RecSport Turf Drainage Detail

Drainage for Non-Porous

Water runs horizontally across top of turf backing at minimum 2% slope toward low end(s) to perimeter curb(s) with weep holes, open fence, or sloped edge.

Drainage for Porous

Water runs through 1/4" diameter perforations in turf backing and adhesive (as shown) into porous basemat. Water then migrates to bottom of basemat and runs horizontally with slope of asphalt or concrete to one or more drainage basins under the basemat.
